

Analysis of the four requirements for relay protection

Overview

Every protection system which isolates a faulty element is required to satisfy four basic requirements: (i) reliability; (ii) selectivity; (iii) sensitivity; and (iv) speed of operation. This handbook covers the code of practice in protection circuitry including standard lead and device numbers, mode of connections at terminal strips, colour codes in multicore cables, dos and don'ts in execution. Without reliability and selectivity the protection would be rendered largely ineffective and could even become. This IEEE PSRC Working Group document presents the aspects of power quality that relates to protective relaying. Each of the relevant standards that proscribe "Power Quality" specification will be. Protective relays and devices have been developed over 100 years ago to provide "lastline" of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. This makes it possible to direct the corrective action to the faulty part of the network and the. Selection of protection relays for different types of objects.

The need to include in these requirements economic indicators of the functioning of relay-protection devices and automation or the reliability of the electric supply, taking into account the

PROTECTIVE RELAYING AND POWER QUALITY

Protection relaying is primarily concerned with clearing faults while power quality is concerned with the delivering of reliable power within certain parameters. The protective relaying fault clearing result in

Research on the analysis method of power system relay protection

The experimental results show that this method can effectively analyze the operation characteristics of power system relay protection, and can accurately check whether the relay
