

How to jumper wires in the main distribution box

Overview

What is the Main Bonding Jumper (MBJ) and How to A Main Bonding Jumper (MBJ) or System Bonding Jumper (SBJ) made of copper, aluminum, or copper Simple 120v.

Key Takeaways

Jumper wires in a main distribution box are used to connect multiple breakers or terminal points, allowing power to be distributed efficiently, but must be installed with proper sizing, insulation, and safety precautions. Understanding Jumpers in a Main Panel

Jumpers are conductors that connect two or more points in an electrical circuit. In a main distribution box, they are commonly used to:

- Connect multiple circuit breakers to a single power source.
 - Distribute power across terminal blocks efficiently.
 - Replace the need for running individual wires to each breaker or terminal point ().
- Jumpers can be pre-manufactured bars or wires designed for specific terminal blocks or breakers. Using the correct type ensures compatibility and safety ().

Step-by-Step Guide

- Turn Off Power: Always switch off the main breaker before working inside the panel to prevent electric shock ().

- **Select the Correct Jumper:** Choose a jumper rated for the amperage of the breakers and the panel. For example, a 60A breaker requires a jumper wire or bar rated for at least 60A ().
 - **Position the Jumper:** Insert the jumper into the designated slots on the terminal blocks or breakers. For terminal blocks, push the jumper into the top of the blocks to create continuity between them ().
 - **Trim Excess:** Cut any excess length so the jumper only connects the intended points. You can also remove individual tines if you need to skip certain breakers ().
 - **Secure Connections:** Ensure all connections are tight and properly seated. Loose connections can cause overheating or arcing.
 - **Check Insulation and Clearance:** Make sure the jumper is insulated where necessary and does not touch other live parts. Avoid tight bends and provide slack for thermal expansion ().
 - **Label and Document:** Mark the jumper to indicate which breakers or terminals it connects. This helps with future maintenance and troubleshooting ().
 - **Restore Power and Test:** Once all jumpers are installed and secured, turn on the main breaker and test the circuits to ensure proper distribution.
- Safety Considerations**
- Only use jumpers rated for the panel's voltage and current.
 - Never bond neutral and ground in subpanels; this is only done in the main panel ().
 - Avoid improvising with undersized wires; always follow NEC guidelines and manufacturer instructions.
 - If unsure, consult a licensed electrician to prevent hazards. By following these steps and using appropriately rated jumpers, you can safely distribute power in a main distribution box while maintaining compliance with electrical standards ().
