

Optical Module Logical Functions

Overview

At the heart of every optical transceiver lie three essential components, often called the “Three Pillars” of optical communication: Laser — generates light. Modulator — encodes data onto the light. Operating at the physical layer of the OSI model, optical modules are core devices in optical. The optical module, known as Optical Transceiver in English, is a general term for various module categories, including optical receiver modules, optical transmitter modules, optical transceiver modules, and optical forwarding modules. Today, when we talk about optical modules, we usually mean. The Transmitter Optical Sub Assembly (TOSA) is responsible for the emission of light. Its primary function entails converting electrical signals into optical signals. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. An optical module is a typically hot-pluggable optical transceiver used in high-bandwidth data communications applications. Among various optical module form factors, SFP (Small Form-Factor Pluggable).
