

Special optical cable splicing

Overview

Fiber splicing is the preferred way when cable lines are too long for a single length of fiber or when combining two different types of cable. Another method of connecting optical fibers is termination or connectorization, which consists of processing the end of a fiber optic bundle so that it can be connected to other fibers or devices through fiber optic. Fiber optic splicing is the process of joining two fiber optic cables together so that light signals can pass with minimal loss or reflection. The goal is to achieve the lowest possible optical loss (signal). As fiber optic connections become increasingly mainstream, the need to connect fiber optic cables to one another — or splicing — is also on the rise. For network managers and technicians, a poor splice can lead to significant signal degradation, network downtime, and costly troubleshooting.
