

## Swiss Optical Isolator Remote Monitoring Type

### Overview

The Swisson XSR Series RDM and DMX Opto-Splitters use optical isolation to completely isolate and boost both DMX and RDM signals. The isolation prevents signal disturbances on separate outputs from affecting other outputs or travelling back through to the input signal connectors. These include narrowband and broadband configurations that operate in spectral ranges from 350 nm to 2100 nm with both polarization-independent and polarization maintain versions and high-power. Thorlabs manufactures a wide selection of narrowband and broadband free-space optical isolators (Faraday isolators) that operate in spectral ranges from 365 nm to 4.55  $\mu\text{m}$ , including high-power options, as well as fiber isolators designed for wavelength ranges from 650 to 2010 nm for. An optical isolator, or optical diode, is an optical component which allows the transmission of light in only one direction. The operation of conventional optical isolators relies on the Faraday. BEI Sensors' optical isolator module is a versatile interface between a sensor and any receiving electronics, providing an electrically robust output to the receiving electronics. More precisely, they exhibit a relatively low propagation loss in one direction, but a much higher propagation loss in the other direction.
