

Various Modules and Pigtail Types

Overview

Pigtail Connectors Guide There are many types of pigtail connectors, each designed for specific applications and technical needs to Pigtail Connector Guide.

Key Takeaways

Pigtail modules are categorized by fiber type, connector type, polish type, and fiber count, each designed for specific network applications.Overview

A pigtail module is a short optical fiber cable with a factory-terminated connector on one end and a bare fiber on the other, used primarily for splicing into optical networks. They provide reliable, low-loss connections and are widely used in telecommunications, data centers, and enterprise networks .

Classification by Fiber Type

- Single-Mode Fiber (OS2): Features a 9/125 μ m core, ideal for long-distance, high-bandwidth applications such as ISP backbones, CATV, and long-haul internet services. Typically has a yellow jacket .
- Multimode Fiber (OM1, OM2, OM3, OM4): Larger cores (62.5/125 μ m or 50/125 μ m) suitable for short-range data transmission within buildings, campuses, or data centers. Jackets are usually orange (OM1/OM2) or aqua (OM3/OM4), .

Classification by Connector Type

- SC Pigtail: Snap-in design, durable, commonly used in telecom and data applications.
- LC Pigtail: Small form-factor, ideal for high-density installations in data centers and LANs.

- ST Pigtail: Bayonet-style coupling, often found in older multimode networks.

- FC Pigtail: Screw-on connector, used in precision applications requiring stable connections .

Classification by Polish Type

- UPC (Ultra Physical Contact): Standard polish with slight curvature for low back reflection; connectors are typically blue.

- APC (Angled Physical Contact): Fiber end-face polished at an 8-degree angle to minimize back reflection; connectors are typically green and used in RF video or sensitive analog transmission .

Classification by Fiber Count

- Single-Fiber Pigtails: Standard for most installations.
- Multi-Fiber Pigtails (e.g., 12-core): Used in high-density environments to reduce splicing time, labor costs, and improve consistency in large-scale deployments .

Applications

Pigtail modules are primarily used to terminate backbone cables within fiber enclosures, patch panels, or ODFs. They allow for fusion or mechanical splicing to incoming fiber cables, ensuring a stable, low-loss connection. High-quality pigtail modules use ultra-pure glass fibers with enhanced tensile strength to withstand mechanical stress and environmental factors, supporting high-speed internet, HD video, and cloud services .

Key Considerations

When selecting a pigtail module, consider:

- Fiber type (single-mode vs multimode)
 - Connector type (SC, LC, ST, FC)
 - Polish type (UPC vs APC)
 - Fiber count (single vs multi-core)
 - Cable structure and color coding for easy identification during installation .
- Choosing the correct pigtail module ensures network reliability, low insertion loss, and long-term performance, making them essential components in modern fiber optic networks.
